

## Derisking R2M

R10 000 over two weeks, 24 August to 6 September, to establish what a UniApply sale actually costs before R2 000 000 is committed against an unmeasured number.

| SPRINT SPEND                                | SALES TARGET                        | COST PER CLICK                          | DECISION DATE                                   |
|---------------------------------------------|-------------------------------------|-----------------------------------------|-------------------------------------------------|
| <b>R10 000</b><br>R5 000 a week, both weeks | <b>61</b><br>The 2% conversion case | <b>R3.29</b><br>Measured, July Meta buy | <b>6 Sep</b><br>Exco releases, holds or re-cuts |

### THE QUESTION

#### Can R2M buy 40 000 sales?

R2 000 000 divided by 40 000 is **R50 a sale**. That is the economics the plan assumes, and it has never been tested against a real transaction. What we know is real: the July Meta buy spent R1 617.57 for 491 link clicks, so a click costs **R3.29**. For that click to become a R50 sale, **6.6% of everyone who clicks must buy**. At the 2% we are working to, a sale costs R164.72 and **R2M buys about 12 100 sales, not 40 000**. Reaching 40 000 at that rate costs R6.59m.

### THE POINT OF THE SPRINT

Nobody knows which world we are in: GA4 carries no purchase event, so no click has ever been tied to a payment. R10 000 answers it. R2M spent on the assumption does not.

### THE TWO LEVERS

#### Cost per sale is the click divided by the conversion

Both have to move to reach R50. Conversion alone does not get there from where the click sits today.

| IF A CLICK COSTS   | CONVERSION NEEDED FOR R50 |
|--------------------|---------------------------|
| <b>R3.29</b> today | <b>6.6%</b>               |
| <b>R2.50</b>       | <b>5.0%</b>               |
| <b>R2.00</b>       | <b>4.0%</b>               |
| <b>R1.50</b>       | <b>3.0%</b>               |
| <b>R1.00</b>       | <b>2.0%</b>               |

At 2% conversion, R50 a sale needs a **R1.00 click**. We are at R3.29. That came from one unoptimised boost so there is real room to move it, but how much is a measurement, not an opinion.

### WHAT R10 000 RETURNS

#### The target is 61, and it is the 2% case

R10 000 buys **3 035 clicks**. What those clicks return is the whole experiment.

| IF CLICK TO SALE IS | A SALE COSTS | SALES FROM R10 000 | THEN R2M BUYS |
|---------------------|--------------|--------------------|---------------|
| <b>0.5%</b>         | <b>R659</b>  | <b>15</b>          | <b>3 000</b>  |
| <b>1.0%</b>         | <b>R329</b>  | <b>30</b>          | <b>6 100</b>  |
| <b>2.0%</b>         | <b>R165</b>  | <b>61</b>          | <b>12 100</b> |
| <b>4.0%</b>         | <b>R82</b>   | <b>121</b>         | <b>24 300</b> |
| <b>6.6%</b>         | <b>R50</b>   | <b>200</b>         | <b>40 000</b> |

Hitting 61 confirms 2%. Missing it says the rate is lower, and says so for R10 000 instead of R2m.

### WHAT IS BEING SPENT

#### R10 000 new. Everything else is already covered.

| LINE                                    | STATUS             | AMOUNT         |
|-----------------------------------------|--------------------|----------------|
| <b>Paid media, Meta</b> , R5 000 a week | New                | <b>R10 000</b> |
| <b>School visit fuel</b> , 29 schools   | Unlocked           | <b>R2 000</b>  |
| Print in house, creative in retainer    | Covered            | <b>R0</b>      |
| <b>Total, two weeks</b>                 | <b>R10 000 new</b> | <b>R12 000</b> |

That is **0.5% of the budget being derisked**, and it sits inside the R250 000 of paid media the Phase 2 plan already carries rather than adding to it.

### ENGINE 1

#### Commercial Sales

|          |                                                                                                                                                                                                           |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AUDIENCE | The paying parent. Measured at <b>60.7% women, largest band 35 to 44</b> , Gauteng first, then KZN and Western Cape.                                                                                      |
| CHANNEL  | All R10 000 into <b>Meta</b> , the only channel with real cost data. Four creative variants, including a <b>20 second recut</b> of the July reel, which runs 53 seconds against a 7 second average watch. |
| PROVES   | <b>Cost per click and click to sale</b> . The two numbers the R2M decision rests on.                                                                                                                      |

### ENGINE 2

#### School Outreach

|          |                                                                                                                                                                       |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AUDIENCE | Grade 11 and 12 learners and the parents behind them, at <b>29 schools</b> across Pretoria and Centurion. Selling direct to the family, not chasing school contracts. |
| CHANNEL  | Five days of visits on R2 000 of already unlocked fuel, a <b>QR code unique to each school</b> , and a take home slip for the parent who pays.                        |
| PROVES   | <b>Sign ups per visit and cost per sale</b> , on the same basis as paid, so the two can be compared on 6 September.                                                   |

### WHAT WE WILL KNOW ON 6 SEPTEMBER

- **What a UniApply sale costs**, both engines, measured not modelled.
- **Whether R2M can buy 40 000**, or what it can actually buy.
- **How far the R3.29 click can be pushed down**, across four variants.
- **Which engine is cheaper**, and where the next rand should go.
- **Whether the measurement chain holds**, from click to Peach to ledger. Nothing has confirmed that end to end.

### THE DECISION THIS BUYS

|                |                                                                                                              |
|----------------|--------------------------------------------------------------------------------------------------------------|
| <b>Release</b> | <b>At or near 6.6%</b> . The plan works as written. Commit R2M against 40 000.                               |
| <b>Re-cut</b>  | <b>Around 2%</b> . R2M buys roughly 12 100. Either the target moves or the budget does, decided on evidence. |
| <b>Hold</b>    | <b>Below 1%</b> . Fix the click and the landing page before any further media is committed.                  |

**Needed from Gradesmatch dev by 24 August.** Counting sales is now a tech function, so the sprint needs **either** the GA4 purchase event **or** an automated feed of cleared Peach transactions. Without one of them no sale can be recorded at all. The landing page and the lead endpoint narrow what we learn rather than stopping it.
