

Derisking R2M

R10 000 over two weeks, 24 August to 6 September, to establish what a UniApply sale actually costs before R2 000 000 is committed against an unmeasured number.

SPRINT SPEND	SALES TARGET	COST PER CLICK	DECISION DATE
R10 000 R5 000 a week, both weeks	61 The 2% conversion case	R3.29 Measured, July Meta buy	6 Sep Exco releases, holds or re-cuts

THE QUESTION

Can R2M buy 40 000 sales?

R2 000 000 divided by 40 000 is **R50 a sale**. That is the economics the plan assumes, and it has never been tested against a real transaction. What we know is real: the July Meta buy spent R1 617.57 for 491 link clicks, so a click costs **R3.29**. For that click to become a R50 sale, **6.6% of everyone who clicks must buy**. At the 2% we are working to, a sale costs R164.72 and **R2M buys about 12 100 sales, not 40 000**. Reaching 40 000 at that rate costs R6.59m.

THE POINT OF THE SPRINT

Nobody knows which world we are in: GA4 carries no purchase event, so no click has ever been tied to a payment. R10 000 answers it. R2M spent on the assumption does not.

THE TWO LEVERS

Cost per sale is the click divided by the conversion

Both have to move to reach R50. Conversion alone does not get there from where the click sits today.

IF A CLICK COSTS	CONVERSION NEEDED FOR R50
R3.29 today	6.6%
R2.50	5.0%
R2.00	4.0%
R1.50	3.0%
R1.00	2.0%

At 2% conversion, R50 a sale needs a **R1.00 click**. We are at R3.29. That came from one unoptimised boost so there is real room to move it, but how much is a measurement, not an opinion.

WHAT R10 000 RETURNS

The target is 61, and it is the 2% case

R10 000 buys **3 035 clicks**. What those clicks return is the whole experiment.

IF CLICK TO SALE IS	A SALE COSTS	SALES FROM R10 000	THEN R2M BUYS
0.5%	R659	15	3 000
1.0%	R329	30	6 100
2.0%	R165	61	12 100
4.0%	R82	121	24 300
6.6%	R50	200	40 000

Hitting 61 confirms 2%. Missing it says the rate is lower, and says so for R10 000 instead of R2m.

WHAT IS BEING SPENT

R10 000 new. Everything else is already covered.

LINE	STATUS	AMOUNT
Paid media, Meta, R5 000 a week	New	R10 000
School visit fuel, 29 schools	Unlocked	R2 000
Print in house, creative in retainer	Covered	R0
Total, two weeks	R10 000 new	R12 000

That is **0.5% of the budget being derisked**, and it sits inside the R250 000 of paid media the Phase 2 plan already carries rather than adding to it.

ENGINE 1

Commercial Sales

AUDIENCE	The paying parent. Measured at 60.7% women, largest band 35 to 44 , Gauteng first, then KZN and Western Cape.
CHANNEL	All R10 000 into Meta , the only channel with real cost data. Four creative variants, including a 20 second recut of the July reel, which runs 53 seconds against a 7 second average watch.
PROVES	Cost per click and click to sale . The two numbers the R2M decision rests on.

ENGINE 2

School Outreach

AUDIENCE	Grade 11 and 12 learners and the parents behind them, at 29 schools across Pretoria and Centurion. Selling direct to the family, not chasing school contracts.
CHANNEL	Five days of visits on R2 000 of already unlocked fuel, a QR code unique to each school , and a take home slip for the parent who pays.
PROVES	Sign ups per visit and cost per sale , on the same basis as paid, so the two can be compared on 6 September.

WHAT WE WILL KNOW ON 6 SEPTEMBER

- What a UniApply sale costs, both engines, measured not modelled.
- Whether R2M can buy 40 000, or what it can actually buy.
- How far the R3.29 click can be pushed down, across four variants.
- Which engine is cheaper, and where the next rand should go.

THE DECISION THIS BUYS

Release	At or near 6.6%. The plan works as written. Commit R2M against 40 000.
Re-cut	Around 2%. R2M buys roughly 12 100. Either the target moves or the budget does, decided on evidence.
Hold	Below 1%. Fix the click and the landing page before any further media is committed.

Needed from Gradesmatch dev by 24 August: the GA4 purchase event, the parent landing page live, and the readiness tracker lead endpoint. Without them the sprint still measures cost per sale, on manual Peach reconciliation, but attributes it more slowly.

Sources. Cost per click, audience and video performance from Meta Ad insights, boost of 29 July 2026, pulled 20 August 2026. School route, distances and fuel from the School Visit Proposal, 24 to 28 August 2026. Budget and pacing from the BridgeApp Phase 2 Operating Workbook v4, May 2026. Working detail and the day 14 gate in the Qualifying Sprint workbook. Every figure here is either reported by a platform or derived from one on this page. None is estimated.
